I have a case that I want to construct a database but when I want to fetch the “primary key” which is a column of a table is a “List”. How

---

can I achieve that? EDIT This is an example of a database I want to fetch using code as follows

```
entities[0].Id = new  
Queryable().Select(c =>  
c.Id).Distinct().OrderBy(x =>  
x).OrderBy(x => x).ToList();
```

What I want is that I can fetch the “Id” through a list. A: If you have a list of entities where the Id is unique, then you could for example implement an IEquatable as follows:

```
public class Entity :  
IEquatable { public int Id { get; set;  
} public override bool
```

---

```
Equals(object other) { if (other is
    Entity otherEntity) return Id ==
otherEntity.Id; return false; } public
    override int GetHashCode() {
        return Id; } } f678ea9f9e
```
